

Freeslides Slide Tubes

Single Patient Use Slide Tubes

Freeslides tubes can be used for many patient-handling tasks and are made from 100% polyester with an anti-static polyurethane coating on the inside. The anti-friction tube decreases resistance and reduces skin shear, making transfers safer and easier for staff and patients. Patient comfort increases while staff muscular-skeletal injuries decrease.

When a patient is anesthetized in an OR or ED, they may need to be repositioned. a Freeslide tube is a quick, easy, and safe solution for this task. By placing a slide tube under the patient before the procedure, you can effortlessly reposition them on their side or vertically or horizontally.

- **Wall Dispenser:** Readily available .
- **Turning:** Turn the patient on their side.
- **Boosting:** Boosted the patient up the table.
- **Lateral Transfer:** Transfer from gurney to table and back.
- **Single Patient Use:** Reduces the risk of cross-contamination.
- **Cost Effective :** Very low cost and sent back with patient for other transfers in the patient room or recovery.
